

AMENDMENTS TO THE CLAIMS

1. (Canceled)
2. (Previously Presented) A shield cover for a liquid crystal display (LCD), comprising:
 - a variable resistor (VR) that optimizes flickering by adjusting a common voltage (Vcom);
 - and
 - a structure arranged over the variable resistor that is openable for adjusting the common voltage,wherein the structure includes a U-shaped opening in the shield cover around the variable resistor, such that the variable resistor is selectively exposable by the structure.
3. (Previously Presented) A shield cover as claimed in claim 2, wherein a corner of the structure is chamfered.
4. (Previously Presented) A shield cover for a liquid crystal display (LCD), comprising:
 - a variable resistor (VR) that optimizes flickering by adjusting a common voltage (Vcom);
 - and
 - a structure arranged over the variable resistor that is openable for adjusting the common voltage,wherein the LCD further includes a module connector connectable to a board connector, the shield cover further comprising an opened part arranged over the module connector, wherein the module connector is connectable to the board connector through the opened part.
5. (Previously Presented) The shield cover as claimed in claim 4, wherein the opened part includes a slit.
6. (Previously Presented) A shield cover as claimed in claim 5, wherein the slit is arranged over an end of the module connector, wherein the slit is opened when the board

connector is connected to the module connected and wherein the slit is closed when the board connector is disconnected from the module connector.

7. (Canceled)

8. (Canceled)

9. (Previously Presented) A shield cover for a liquid crystal display (LCD), wherein the LCD includes a printed circuit board (PCB) at a rear of a display module, comprising:

a covering structure over the PCB, the covering structure comprising at least one elastically deformable region;

a slit in the covering structure over the PCB; and

a variable resistor at the rear of the display module that optimizes flickering by adjusting a common voltage (Vcom), the shield cover further comprising a flap in the covering structure over the variable resistor,

wherein the flap includes a chamfered corner portion.

10. (Previously Presented) A shield cover for a liquid crystal display (LCD), wherein the LCD includes a printed circuit board (PCB) at a rear of a display module, comprising:

a covering structure over the PCB, the covering structure comprising at least one elastically deformable region;

a slit in the covering structure over the PCB; and

a variable resistor at the rear of the display module that optimizes flickering by adjusting a common voltage (Vcom), the shield cover further comprising a flap in the covering structure over the variable resistor,

wherein the flap is U-shaped.

11. (Original) The shield cover of claim 10, wherein the flap includes a chamfered corner portion.

12-14. (Canceled)

15. (Previously Presented) The shield cover according to claim 16, wherein a corner portion of the flap is chamfered.

16. (Previously Presented) A shield cover for a liquid crystal display device having at least one device component, comprising:

at least one elastically deformable region, wherein the at least one device component is selectively exposable by the at least one elastically deformable region;

wherein the at least one device component includes a variable resistor;

wherein the at least one elastically deformable region includes a flap; and

wherein the flap is elastically deformable away from the variable resistor to selectively expose the variable resistor.

17. (Previously Presented) A shield cover for a liquid crystal display device having at least one device component, comprising:

at least one elastically deformable region, wherein the at least one device component is selectively exposable by the at least one elastically deformable region;

wherein the at least one elastically deformable region is arranged proximate the slit.

18. (Previously Presented) The shield cover according to claim 17, wherein the at least one device component includes a module connector arranged on a printed circuit board (PCB) and wherein the module connector is connectable to a board connector through the slit.

19. (Previously Presented) The shield cover according to claim 18, wherein the at least one elastically deformable region arranged proximate the slit is elastically deformable toward the modular connector to selectively expose the modular connector.

20. (Previously Presented) The shield cover according to claim 18, wherein the at least one elastically deformable region arranged proximate the slit is arrangeable beneath the board connector.

21. (Canceled)
22. (Canceled)
23. (Previously Presented) A liquid crystal display (LCD), comprising:
 - a display module;
 - a printed circuit board (PCB) fitted to the display module;
 - at least one device component on the PCB; and
 - a shield cover on the PCB, the shield cover including at least one elastically deformable region spaced over the at least one device component;
 - wherein the at least one device component includes a variable resistor; and
 - wherein the at least one elastically deformable region includes a flap formed over the variable resistor.
24. (Previously Presented) The LCD according to claim 23, wherein a corner portion of the flap is chamfered.
25. (Previously Presented) The LCD according to claim 23, wherein the flap is elastically deformable away from the variable resistor to selectively expose the variable resistor.
26. (Previously Presented) The LCD according to claim 23, wherein the at least one device component includes a module connector arranged on the PCB, wherein the module connector is connectable to a board connector.
27. (Previously Presented) The LCD according to claim 26, wherein the shield cover includes a slit formed over the module connector.
28. (Previously Presented) The LCD according to claim 27, wherein the at least one elastically deformable region is arranged proximate the slit.

29. (Previously Presented) The LCD according to claim 28, wherein the at least one elastically deformable region arranged proximate the slit is elastically deformable toward the modular connector to selectively expose the modular connector.

30. (Previously Presented) The LCD according to claim 28, wherein the at least one elastically deformable region arranged proximate the slit is arrangeable between the board connector and the display module.
